VNet Peering

What is VNet Peering?

Connect **two VNets privately** using Azure backbone.

Types

- Same region (Local peering)
- Different region (Global peering)

Features

- Low latency
- No VPN required
- Uses private IPs

💡 Used heavily in **Hub-Spoke architecture**.

VNET Peering

🛠️ Practical Lab – Create VNet Peering

We will connect:

- `VNet-A` → 10.0.0.0/16
- `VNet-B` → 10.1.0.0/16

Step 1️⃣ Create Two VNets

Create two VNets in same region:

VNet-A

- Address space: `10.0.0.0/16`
- Subnet: `10.0.1.0/24`

VNet-B

- Address space: `10.1.0.0/16`
- Subnet: `10.1.1.0/24`

Step 2️⃣ Configure Peering from VNet-A

Go to:

Virtual Networks → **VNet-A** → **Peerings** → + Add

Fill:

- Peering link name: `A-to-B`
- Remote VNet: Select `VNet-B`
- Allow virtual network access ✅
- Allow forwarded traffic (optional for hub-spoke)
- Allow gateway transit (if using VPN)

Click **Add**

Step 3️⃣ Configure Peering from VNet-B

Repeat same:

Virtual Networks → **VNet-B** → Peerings → + Add

- Name: `B-to-A`
- Remote VNet: `VNet-A`
- Allow virtual network access ✅

Click **Add**

Step 4️⃣ Verify Peering Status

Check:

VNet → Peerings → Status should be:

✅ Connected

🧪 Test Connectivity (Important for Practice)

1. Deploy one VM in VNet-A
2. Deploy second VM in VNet-B
3. Use private IP to ping

If NSG allows, ping will succeed.
